

SCENE 01 • INTRODUCTION

From Full Stack to AI-Native Engineer

What actually changes?

"What does 'full stack' mean when the engineer is no longer working alone?"

- ▲ The AI Native Engineer combines human engineering judgment, AI agents, architecture, automation, and platforms into a single workflow.
- ▲ Not an engineer who simply uses ChatGPT. Not one who delegates everything to an agent.

SCENE 02 • GROWING COMPLEXITY

The Stack Got Bigger

The modern production system grew far beyond frontend, backend, and a database.

Frontend • Backend • API Gateway
Authentication • Database • Cache
Message Queue • Object Storage
Containers • CI/CD • Cloud
Observability • Security • Analytics

- ▲ The Full Stack Engineer increasingly became a systems engineer.
- ▲ Understanding the code was no longer enough — you needed to understand how the system behaved.

SCENE 03 • A NEW UNIT OF WORK

AI Changes the Unit of Work

The engineer is no longer simply writing software — they're orchestrating its production.

```
Engineer
  ↓
AI Orchestrator
  ↓
Coding Agent • Testing Agent • Review Agent
  ↓
CI/CD → Production
```

- ▲ AI Native does not mean AI dependent — the stronger the engineer's fundamentals, the more useful AI becomes.

SCENE 04 • THE REAL SKILL

Context Engineering Is the Real Skill

Prompting is only a small part of the picture.

"A vague prompt can produce a plausible answer. A well structured engineering environment can produce a useful implementation."

- ▲ The repository becomes the contextual interface between humans and AI agents.
- ▲ Files like AGENTS.md, README.md, and ARCHITECTURE.md communicate rules and constraints directly to agents.

SCENE 05 • SPECIALIZATION

Agent Specialization & Orchestration

Narrower agent responsibility improves control and quality — but only with coordination.

Architecture Agent → Implementation Agent
→ Testing Agent → Security Agent
→ Performance Agent → Documentation Agent

- ▲ Five agents modifying the same system without coordination can each look reasonable individually — and still break the system collectively.
- ▲ The engineer becomes responsible for designing that workflow.

SCENE 06 • CONTROLLED BOUNDARIES

The New Stack: RAG, Tools, Platform Boundaries

AI Models, Agents, Tools, RAG, Context, Orchestration, Evaluation, Observability, Governance.

- ▲ Tool calling lets agents query data, run tests, open pull requests, and deploy — AI is no longer just generating text, it's operating software systems.
- ▲ A platform can expose controlled capabilities instead of unrestricted infrastructure access.

SCENE 07 • NEW ECONOMICS

The Value Moves Upward

If AI makes code generation cheaper, raw code production becomes less differentiated.

"When code is cheap, correctness becomes expensive."

- ▲ Value moves toward understanding, architecture, specification, decision making, orchestration, validation, and ownership.
- ▲ Breadth becomes an advantage — an engineer who understands the whole system can delegate intelligently.

SCENE 08 • CONCLUSION

Engineering With AI, Not Just Using It

Using AI means asking a model to write code. Engineering with AI means designing the environment where it can safely contribute.

Understand → Specify → Decompose
→ Orchestrate → Generate → Validate
→ Observe → Learn → Improve

- ▲ The Full Stack Engineer is not disappearing — the stack is simply getting bigger.
- ▲ The ability to orchestrate the system that produces the code may become just as important as the code itself.
